Acknowledgements

Our grateful thanks go to the following who contributed to this report:

- Rural Business Research (www.ruralbusinessresearch.co.uk) and its constituent RBR Units throughout England who were responsible for data collection in England;
- The Welsh Farm Business Survey unit at Aberystwyth University who were responsible for data collection and provision of additional beef and lamb benchmarking data in Wales;
- John Burrows for previous technical assistance with the clustering and data extraction procedure;
- Department for Environment, Food and Rural Affairs (Defra) Statistics and Farm Business Survey Divisions for supplying data for analysis;
- And most especially to all the farmers who gave of their time and information, without which this work would not be possible.

Data were supplied by Defra with whom copyright rests. Although all efforts are made to ensure the quality of the farm data supplied, the copyright holder, the original data producer, Defra and the Data Archive, bear no responsibility for the accuracy or comprehensiveness of these materials, or for their further analysis or interpretation.

We gratefully acknowledge previous funding for this project from Defra and current funding from the Welsh Government through Organic Centre Wales. The views and interpretations expressed here are those of the authors, and do not represent views of Defra or the Welsh Government.

Executive Summary

This report presents results of research on the financial performance of organic farms in the **2013/14** financial year (with **2012/13** data for reference). This research, partly funded through the Welsh Government, continues on from the Defra funded project; OF0373 and previous work on the economics of organic farming carried out at Aberystwyth University (Projects OF0190, covering 1995/96 to 1998/99 and OF0189, covering 1999/00 to 2004/05)¹.

This report utilises data collected through the Farm Business Survey in England and Wales, and analysis of the dataset for 2013/14 found a total of 222 businesses with some organic land. To ensure the analysis undertakes a comparison of organic and conventional farms, the organic sample comprises holdings with at least 70% fully organic land (>=70% of UAA ha), therefore farms identified as "in-conversion" and those with less than 70% fully organic land were excluded from the analysis, providing a sample of 190 organic holdings.

To allow for a fairer comparison with conventional farms, the organic holdings were matched with clusters of comparable conventional holdings; utilising data from 850 conventional farms. The clustering process ensures farms have a similar resource base e.g. similar land area, farm type, region and other factors. A minimum of 3 **comparable conventional farms** (CCF) were clustered to each organic farm, and in total, data from 176 organic farms was included in the analysis. It was not possible to identify comparable conventional businesses for some organic farms, and the sample of organic specialist pig and poultry farms was not assessed (due to small sample sizes).

The data was analysed as two samples; a **full sample** and an **identical sample**. The full sample analysis utilised data from all 179 organic farms and provides the best comparison of organic and comparable conventional farm income data in 2013/14. The identical sample identifies year to year changes within systems of 132 farms, though the sample sizes are smaller.

The results are presented by farm type² as un-weighted means of organic and CCF groups. Differences in profitability were also assessed with t-test analysis of Farm Business Income (FBI) results; however some of the samples were small and had large variation which will have reduced the likelihood of statistical differences being identified.

The **full sample** results are presented in Figure A (overleaf), and indicate that in 2013/14 the profitability (Farm Business Income) of most organic farm types was similar to that of comparable conventional farms, confirmed by no statistically significant t-test results, except for some year to year changes within farm types, (see Table B).

Figure B indicates the total income and various income sources for organic (O) and conventional (C) farm types (horticultural farm types are excluded from Figures B and C for clarity). It can be seen that although organic farms received greater agri-environment payments per hectare than conventional holdings, the majority of their income originates from livestock and cropping outputs. The figure also indicates a high level of support payments compared to total income for both organic and conventional cattle and sheep holdings.

² Farm type is now defined by the SO method, rather than the SGM method previously used, however, the 2012/13 samples used in this report have been updated to ensure consistency with the new data.

Figure A Organic and conventional Farm Business Income (£/ha, full samples, 2013/14)

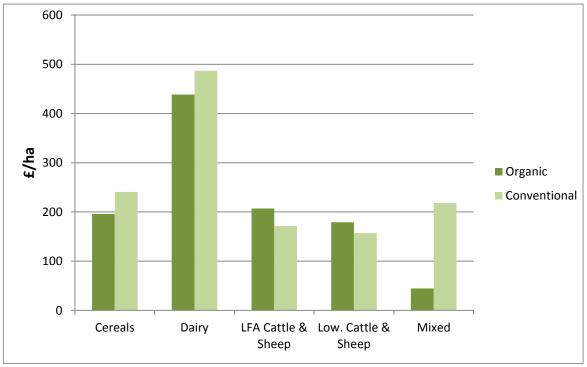

Figure B Organic and conventional farm income sources (£/ha, full samples, 2013/14)

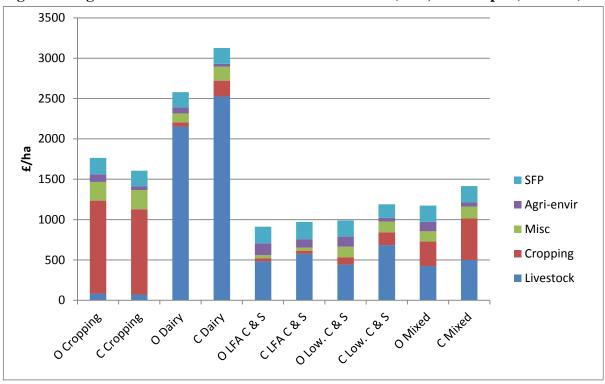

Figure C shows costs per ha for organic (O) and conventional (C) farm types. Total costs were lower or similar for most organic farm types. Crop input costs such as fertiliser and crop protection were lower, as were livestock costs for all types except mixed farms; other costs varied by farm type.

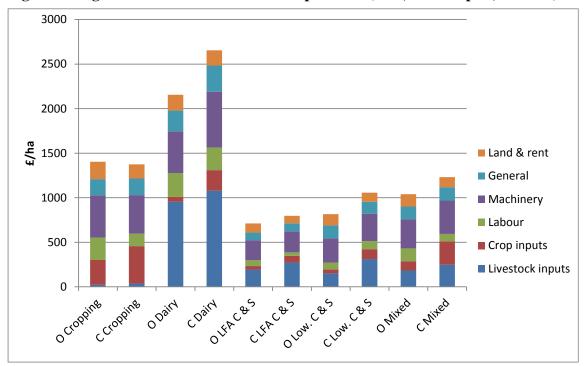

Figure C Organic and conventional farm input costs (£/ha, full samples, 2013/14)

The **identical sample** indicates year to year changes, with the percentage change in FBI (\pounds /ha) between years shown in Figure D. The chart highlights a mixed year for organic farms with dairying and cropping seeing greater profitability whilst other livestock types saw decreasing returns. The statistical analysis found that profitability (\pounds /ha) was significantly lower between years on conventional cropping and LFA farms, but not significantly lower for organic farm types.

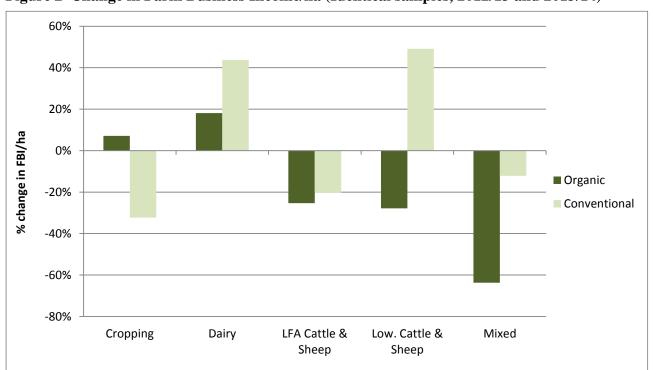

Figure D Change in Farm Business Income/ha (Identical samples, 2012/13 and 2013/14)

A summary of Farm Business Income per farm and per hectare is shown in Table A, below.

The differences between organic and conventional systems (2013/14), and year to year changes (2012/13 vs. 2013/14) were also assessed for statistical significance with the student's t-test. Differences and their statistical significance are presented in Table B below and have already been discussed in the text above:

Gross (GM) and Net Margin (NM) data were also calculated for organic and conventional systems, and summary data are shown in Table C and Table D below. The organic livestock net margins are characterised by similar financial output (less output volume but sold at a higher price), lower variable costs (due to feed and fertiliser savings) but higher fixed costs per head due to lower

stocking rates. Both organic and conventional net margins tended to be negative for beef and sheep sectors but the conventional dairy net margin before imputed costs was superior to organic. However, the addition of support payments to NM results in a superior organic financial performance.

Table C Organic and conventional livestock enterprise net margins (£/head), 2013/14

			She	еер		В	eef		
All values £ per cow or ewe	Dai	ry	LF	A	Suckler	stores	Suckler f	inishing	
			Higher	output	LF	A	Lowland		
	Org.	Conv.	Org.	Conv.	Org.	Conv.	Org.	Conv.	
Output	2132	2253	99	88	801	827	1126	1566	
Variable costs	966	1076	47	55	295	479	476	895	
Gross Margin	1166	1177	52	33	506	349	650	671	
Fixed Costs	902	802	69	49	557	607	1147	1019	
Total actual costs	1868	1878	116	104	852	1086	1622	1914	
Net Margin after actual costs	264	375	-17	-16	-51	-258	-497	-348	
Imputed costs (IC)	382	427	40	42	399	463	520	675	
Net Margin after all costs	-117	-52	-57	-58	-451	-722	-1016	-1023	
Support payments*	251	154	51	33	604	522	870	642	
NM (incl. support payments)	133	101	-6	-25	153	-200	-146	-381	

^{*=} also includes miscellaneous output e.g. forage sales

Crop net margin results indicate a generally positive theme for organic enterprises. Organic cereal crops seemed to have lower output, but organic beans and potatoes showed a greater output. Organic crop variable costs were generally lower or similar, but fixed costs were higher. Overall, after all costs and with the addition of support payments, organic crop net margins were greater than conventional crops. Data for a greater range of enterprises are presented in Chapter 3.

Table D Organic and conventional crop enterprise net margins (£/ha), 2013/14

All values £/ha	Winter	Wheat	Spring	Barley	Feed I	Beans	Pota	toes
	Org.	Conv.	Org.	Conv.	Org.	Conv.	Org.	Conv.
Output	1117	1344	834	911	892	867	6827	4905
Variable costs	232	515	177	350	173	292	1828	1865
Gross Margin	884	829	657	560	719	575	4998	3039
Fixed Costs	804	804	807	680	722	640	2377	1636
Total actual costs	1036	1319	984	1030	895	932	4206	3501
Net Margin after actual costs	80	26	-150	-120	-3	-65	2621	1404
Imputed costs (IC)	161	225	131	194	152	198	1113	531
Net Margin after all costs	-81	-199	-281	-314	-155	-263	1508	873
Support payments*	313	306	327	302	320	303	276	305
NM (incl. support payments)	232	107	46	-12	165	40	1784	1178

^{*=} also includes miscellaneous output e.g. forage sales

In summary, the analysis of 2013/14 data showed no statistical differences in the farm business income per farm or per hectare of organic and comparable conventional farms. At enterprise level, organic and conventional dairying net margins were very similar, whilst for beef and sheep enterprises, organic net margins were positive for suckler beef whereas conventional were negative, whilst conventional margins were more negative than organic for sheep and finishing beef. Cropping enterprises also showed a positive position for organic activities. Overall, the analysis can conclude that organic farms are performing at least as well as comparable conventional farms.

Introduction

This report continues the series previously funded by Defra under Project OF0373, and other reports on organic farm incomes that started with the 1995/96-1998/99 period under MAFF project OF0190 and continued from 1999/00-2004/05 under Defra Project OF0189³. We gratefully acknowledge some financial assistance from the Welsh Government for the analysis and reporting of the 2012/13 and 2013/14 data.

The aim of this report is to show the financial performance of organic farms in order to inform Defra and Welsh Government policy-making with respect to organic farming and provide a basis for assessments by farmers, advisers and other interested parties of the farm-level implications of conversion to and continued organic farming. The results are differentiated by farm type for accounting years ending 2013/14, including comparisons with similar conventional farms and with 2012/13 data.

This report includes a section on methodology, which shows the data sourcing and sampling techniques used to obtain a representative organic farm sample, as well as an explanation of the clustering procedure used to select comparable conventional farms (CCF) to match the organic farms. The financial results are presented with an explanation of the results and brief highlights, followed by summary data for each farm type. As in previous years, the 2013/14 report uses Farm Business Income (FBI) indicator as the headline profitability figure, in line with publishing by Defra and the devolved administrations. Detailed gross and net margins are included for livestock and cropping enterprises, as are benchmark costs of production per tonne and per litre for arable and milk respectively.

The detailed whole-farm results can be found in Appendix 1 and detailed enterprise-specific gross and net margin results in Appendix 2 and costs of production data in Appendix 3, with methodological details in Appendices 4-7.

Please note that in data tables, sub totals and totals may not exactly equal the sum of the column due to the rounding of numbers, but the difference should be minimal.

1. Methods

In this report, financial and physical farm data are shown for the 2012/13 and 2013/14 financial years. The report includes an analysis of organic farms including comparisons with similar conventional farms and between year comparisons, presented as full and identical samples.

Data Sample

As in previous OFI reports, the data analysed within this report was collected as part of the English and Welsh Farm Business Surveys by the constituent Rural Business Research Units in England and by the Welsh Farm Business Survey Unit at Aberystwyth University. The standard Farm Business Survey methodology⁴ was used for all farms.

Financial results were obtained from businesses in England and Wales with account years ending between December 2013 and April 2014. The data for all the organic and non-organic farms surveyed was collated by Defra, stored in the Defra Data Archive and made available to Aberystwyth University for analysis.

The analysis within this report is focused on farm businesses having at least 70% organic land status in 2013/14. Of the total of 222 businesses with some organic land identified in the Defra Data Archive, 190 met the greater than 70% fully organic land criterion (see Table 1). Of these, it was not possible to identify comparable conventional businesses for seven holdings, whilst four organic specialist pig/poultry farms were also excluded due to sample size limits for disclosure.

^{*} GM - Farms used for gross margin data purposes only as no comparable whole-farm data available. Figures in parentheses indicate businesses for which clustering was not possible and additional farms excluded for technical reasons.

Farm Types

This report uses the Standard Output (SO) typology, rather than the Standard Gross Margin (SGM) typology used up to 2012. To provide an indication of farm economic size within each typology, the distribution of the businesses by economic size (ESU) and type is shown in Table 2.

_

See http://www.defra.gov.uk/statistics/foodfarm/farmmanage/fbs/aboutfbs/datacollection/ for further information on the farm accounting system employed in England and Wales by Defra Economics Division.

Comparable Conventional Farms (CCF)

An additional element of this work is the inclusion of comparable conventional farm data (obtained from the main FBS sample) for the farm types shown. Each organic farm within this study was matched with a cluster of conventional farms based on the resource endowment indicators for individual organic farms. Indicators included farm type, FBS region, Less Favoured Area (LFA) status, utilisable agricultural area (UAA); farm business size and milk quota held (where applicable). The milk quota indicator was relaxed in 2012/13 due to the reduced constraining effect of milk quota size and this approach was continued in 2013/14. The clustered conventional farm data were averaged for each farm type to derive the comparable conventional farm (CCF) data based on the organic farms from the identical and full farm samples.

The full clustering procedure is outlined in Appendix 7, but in brief, the average for the group of individual organic businesses is then compared with the average for the group of conventional farm clusters. The intention is to ensure, as far as possible, that differences between organic and conventional farms can be attributed to their management system and not to differences in business resource endowment that are not related to the production system employed.

Data Analysis Method

The 2013/14 report continues to utilise the software process that was employed to carry out the data analysis over the last few years, ensuring full comparability. Custom built Java programs are used to sort the Defra dataset, to cluster conventional farms and to extract the relevant data from the database. MS Excel was utilised to undertake the two-tailed student's t-test statistical comparison of the mean profitability (FBI) of the different farm systems and years.

Samples

The full samples for each farm type include all data available for organic holdings that comprise over 70% fully organic land within the Defra dataset. This sample is primarily used to compare the performance of organic farms with clustered comparable conventional farms. Both organic and conventional farm data is collected from the same time period and should reflect direct differences between the two systems.

The identical samples include data from samples of organic and comparable conventional farms that are available in the data set for both years. This sample highlights between year changes, such as output or input cost changes within each sector.

Occasionally the two samples may show conflicting results, but the full sample is the best indicator of organic *vs.* conventional comparisons, the identical sample the best indicator of between year changes within each sector.

To ensure anonymity of results for farmers participating in these surveys, no data are presented for groups of less than five farms. However, it should be noted that individual farm results can still have a significant effect on average results for these small samples, so that where possible, results are presented for groups of more than 15 businesses. Where results are presented for groups of less than 15, the results should be treated with some caution.

The full samples of organic farms per robust farm type are sufficiently large to give some reasonable level of confidence in the data although it should be noted that the organic farm samples are not necessarily statistically representative of their type, as most have been selected to meet the statistical needs of the Farm Business Survey as a whole, not this study. However, the results can be seen as a reasonable indication of farm income levels for comparable organic and conventional farms.

Results Presentation

Summarised and detailed financial input, output, income, returns to labour and capital, liabilities and assets and some physical performance measures are presented based on current FBS data collection and collation guidelines.

Whole farm data is presented in Appendix 1 and is summarised in tables in Section 2. Data is calculated for most robust types (e.g. cereals) and some individual farm types (e.g. LFA Cattle & Sheep), depending on sample sizes.

The results include a large number of variables for both financial and physical outputs and inputs in addition to factors such as labour and investment returns. This report focuses on the Farm Business Income (FBI) measure adopted by Defra and the Welsh Assembly Government, but the previously used Net Farm Income (NFI) figures are also shown in the detailed appendix data. The newer income measure is intended to reflect more closely actual profitability of farm businesses and does not include the adjustments designed to make farms comparable in terms of land tenure, reliance on borrowed capital and reliance on unpaid staff which Net Farm Income and Management and Investment Income were intended to do. As a result of the exclusion of notional costs for unpaid resources, Farm Business

Income values are typically higher than Net Farm Incomes, but the relative performance of organic and conventional farms is similar in most cases.

Gross and net margin data are included for selected organic livestock and crop enterprises. Margins for organic dairy herds are presented on a herd size and top performing herds basis as well as a regional basis, in addition to a two year identical sample. Cattle and sheep gross margins are shown for lowland and LFA farm types. For arable crops, gross and net margins are also shown, and include winter and spring wheat, spring barley, spring oats, and beans for stock feed. Where available, 2012/13 organic and conventional gross margin data are shown alongside the 2013/14 data. The conventional farm data are included from holdings that have been clustered within the whole farm section of this report.

Benchmark costs of production data are shown for organic milk and arable crop production enterprises using the full FBS sample. Costs of production data for breeding beef, finishing beef, and lamb enterprises are calculated using only Welsh FBS data due to availability of livestock sale weight data.

2. Whole-farm results

2.1 Presentation of results

The summary section shows tables for each farm type giving breakdowns of average outputs, inputs and incomes in £/ha; for cropping, horticulture (intensive horticulture), dairy, LFA and lowland cattle and sheep and mixed farms for identical and full samples. The terms *input* and *output* are used to define financial values rather than physical quantities (for further definitions of terms see Appendix 5). All whole-farm results for each farm type in this section and the appendices are simple averages.

Tables A1 to A7 in Appendix 1 (page 30 onwards), provide detailed figures for whole-farm outputs, inputs, incomes, returns to labour and capital, asset and liability information, land utilisation and crop performance, and stocking and livestock performance for the eight farm types. Other physical information available, in addition to the financial data collected, includes figures for livestock units per forage hectare, and labour units per farm. Where direct labour data were not available, labour units have been derived from wages paid using standard agricultural wages (based on Agricultural Wages Board). All labour-use figures presented are, however, based on estimated hours and should be treated with caution.

Values per hectare shown are weighted averages per hectare of farm utilised agricultural area (UAA) rather than per hectare of a specific enterprise because presenting the whole-farm situation reflects the interdependence of enterprises. For example, organic horticultural businesses cannot crop their entire land each year and this has a considerable influence on the overall farm profitability. However, gross/net margin data are shown separately to provide an indication of individual enterprise performance within farm businesses.

In line with changes to Farm Business Survey practice, two main income measures are shown: Farm Business Income and Net Farm Income. Other previously used income measures (management and investment income, occupiers' net income and cash income) are not shown but can be derived from the results presented if required.

Farm Business Income (FBI) is the headline profitability figure and represents the return to all unpaid labour (farmers, spouses and others with an entrepreneurial interest in the farm business) and to all their capital invested in the farm business including land and farm buildings. FBI excludes notional rental values for owner-occupied land and unpaid labour included in NFI, but includes interest and other capital charges. It is designed to better reflect overall business performance including the increasing levels of business diversification currently found on farms. 2013/14 data also includes directors' remuneration as a capital withdrawal from the business, in line with FBS practise from 2008/09 onwards.

Net Farm Income (NFI) is shown below the FBI figure for information and represents the return to farmer and spouse for their manual and managerial labour and on the tenant-type capital invested in the farm. For this measure, all farms are effectively treated as tenanted and a rental value is imputed as an expense for owner-occupied land. The cost of permanent improvements to farms, together with any capital grants relating to such work, are excluded, although such landlord-type improvements will be reflected in higher rent or rental value charges. Debt servicing charges incurred by farmers on farm borrowing or the leasing of equipment are also excluded. Unpaid labour (other than that of farmer and spouse) is treated as if paid at standard rates.

2.2 Summary of whole-farm Farm Business Income results

Table 3 summarises the Farm Business Income (FBI) results for full samples and identical samples of organic and similar conventional farms on a whole farm and per ha basis for 2013/14 and 2012/13.

^{*}Type: Organic=Organically managed farms, CCF=Comparable Conventional Farms

Table 4 indicates differences in farm profitability between organic and conventional systems, and year to year results. The differences in mean figures were assessed using a two-tailed student's t-test. Probably due to variability in profit (within sample) and the small size of some of the samples few significant differences were indicated. The analysis showed no difference in FBI between organic and comparable conventional farms. Changes between years were more marked though, with a significant profitability reduction for LFA Cattle and Sheep farms across both sectors. The conventional sector identical sample also saw significantly lower profitability per hectare (year to year) for Cropping and Lowland Cattle and Sheep farm types.

Net Farm Income	274	156	185	242	114	90	156	271

The 2013/14 *full sample* indicates that FBI per ha was very much higher for organic holdings, with greater output and similar costs. Both organic cropping output and agri-environment payments were substantially higher than on conventional farms. Total costs were similar but organic farm crop input costs were much lower, whilst machinery and labour costs were higher.

The *identical samples* showed a marginal increase in organic holding profitability, whilst conventional holding FBI/ha decreased due to lower output, despite similar costs.

Organic crop yields remained substantially lower than conventional e.g. conventional wheat yield of 7.4t/ha vs organic wheat yield of 3.3t/ha, with both sectors showing increased yields in 2013/14. However, the average organic wheat price was lower at £257/t compared to £308/t in 2012/13, whilst the average conventional price was lower at £163/t.

Overall, organic cropping holding profitability improved in 2013/14, remaining competitive with the conventional sector.

The horticulture holding data has historically been difficult to assess due to the small sample sizes and large variation in intensity of production between holdings. The sample sizes remained small but similar in 2013/14, though these still represent a broad range of systems and vary significantly in their intensity compared to the conventional sample.

The 2013/14 *full sample* indicates the average organic holding FBI per ha to be much lower than comparable conventional holdings, as in previous years. Organic holding output was around 25% of conventional reflecting their lower intensity, however, organic costs were also much lower than conventional; with labour and cropping input costs at between 10 and 25% of the conventional level. Overall though, conventional holding FBI per ha remained higher for both 2012/13 and 2013/14 financial years. However, when the FBI is assessed per annual worker unit (AWU), the sector results are much closer, with organic at £6342/and CCF at £9439/AWU in 2013/14, and £3745 and £4590/AWU respectively in 2012/13. Return per AWU does not vary as much as per ha, reflecting the wide range of land use intensities for different horticultural activities and that labour may be employed to the extent that is financially justified or affordable.

The *identical sample* showed no substantial change in organic profitability over the two years, but conventional holdings showed a decrease in profitability, due to lower output.

Overall, conventional horticultural holdings remained financially superior to organic holdings mainly due to higher output from a smaller area through increased intensity of farming. Organic systems appear less profitable per farm hectare, in part due to the need for a fertility-building phase in the rotation, but are less reliant on external inputs to maintain income, and income per AWU is not that different.

2.5 Dairy farms

For detailed results see Appendix 1, Table A3, pages 46-53.

The LFA and lowland dairy samples are combined to due to a continued decrease in the number of LFA dairy holdings within the sample.

The *full sample* results indicate that organic dairy farm FBI was slightly below conventional levels, but that NFI showed a similar profitability in 2013/14. Organic farm output was lower, with less livestock and cropping output but livestock and crop inputs were also much lower, especially crop costs due to less reliance on fertiliser, as well as lower machinery costs.

The *identical samples* showed an increased FBI/ha for both organic and conventional farms. Organic farm data indicated an increase in output, but also an increase in costs, whilst the conventional sector showed a similar pattern.

In terms of milk production, the average organic milk yield was 5985 litres/cow, lower than the average conventional holding yield of 7229 litres/cow. Both sectors showed milk price increases; the organic milk price was 35.2ppl; compared to the average conventional price of 31.5ppl.

Overall, the data indicates that organic dairying remains competitive with the conventional sector and is potentially less exposed to external input price volatility.

2.6 LFA Cattle and Sheep

For detailed results see Appendix 1, Table A4, pages 54-61.

Through combining the four main LFA cattle and sheep farm types, the robust farm type sample comprised 41 organic farms in 2013/14, lower than in 2012/13.

The 2013/14 *full sample* highlighted how organic LFA cattle and sheep farm profitability remained above comparable conventional farms, though the margin was lower and not statistically different. Organic FBI/ha was higher despite slightly lower livestock output; being offset by considerably greater agri-environment payments, resulting in a higher overall output. Organic livestock and crop inputs were lower than conventional, and overall organic farm costs were slightly lower.

The *identical samples* showed a decrease in profitability for both organic and conventional farms with lower output and higher costs.

LFA organic finished cattle prices averaged £1280/head; higher than 2012/13, whilst the conventional average of £1210 was also considerably improved from 2012/13. The LFA holding organic finished lamb price was identical to the conventional price, at £68/head, marginally greater than in 2012/13.

Overall, despite reduced profitability organic LFA cattle and sheep holdings appeared to remain more profitable than their conventional counterparts in 2013/14.

2.7 Lowland cattle and sheep farms

For detailed results see Appendix 1, Table A5, pages 62-69.

Net Farm Income	125	62	155	57	135	190	71	21

The 2013/14 *full sample* was slightly larger than in 2012/13 and indicated that organic lowland cattle and sheep holding profitability (FBI) was higher than comparable conventional holdings. Total output on organic holdings was lower despite greater miscellaneous support payments but costs were much lower, especially for livestock and crop inputs.

The identical sample showed a decrease in FBI for the organic sector due to lower output, whilst the identical conventional farm sample showed greater output and improved profitability.

Lowland organic finished cattle prices averaged £1241/head, slightly higher than the conventional average of £1230/head, whilst the lowland holding organic finished lamb price was similar to the conventional price, at £77/head and £78/head respectively, similar to 2012/13.

Overall, whilst profitability of organic lowland cattle and sheep holdings decreased in 2013/14, comparable conventional holding profitability remained behind that of the organic holdings.

2.8 Mixed farms

For detailed results see Appendix 1, Table A6, pages 70-77.

Net Farm Income	48	66	80	190	-34	40	128	161

The 2013/14 *full sample* indicated that mixed organic farm profitability remained below that of comparable conventional farms, though there was less difference in the 2013/14 results than in 2012/13. Total output was lower for organic holdings, with lower cropping output, whilst inputs were also lower, especially for crop input costs.

The *identical sample* showed decreased profits for organic and conventional farms. Total output improved for the organic sector and slightly improved for conventional farms, but organic and conventional costs increased.

Organic mixed farms saw an increased average wheat yield of 3.5t/ha compared to 2.8t/ha in 2012/13, however the organic wheat price was lower at £246/t compared to £289/t in 2012/13. However this compares to 7.1t/ha, up from 6.2/ha in 2012/13 and £156/t vs. £177/t in 2012/13 for conventional production. Organic and conventional finished cattle prices were higher at £1315 and £1205 per head and lamb was slightly lower at £78 and £80 per head for organic and conventional respectively.

Overall, both organic and conventional mixed farm profitability was poor and lower in 2013/14, though conventional profitability remained higher than the organic level.

3. Enterprise gross and net margins

Tables 11 to 14 show gross and net margin results for selected organic livestock and crop enterprises for 2013/14 and 2012/13, with comparative conventional data shown where available. More detailed data is shown in Appendix 2, page 78. (Caution is required when making comparisons between years as only Table 11 has an identical sample for both years).

Gross and net margin figures are for certified organic enterprises, but may include some livestock/crops sold at conventional prices. Arable benchmark costs of production are included in this section as the results are derived from the gross/net margin data based on achieved yields. Not all crop results are shown due to small samples.

All gross/net margin data has been calculated as un-weighted averages. Crop outputs include revenue and imputed values for farmhouse consumption, feed used on farm and a closing valuation for any unsold crop. It should be noted that feed values and closing valuations may be undervalued (i.e. not valued at achievable organic premium prices) in the recording process – however, this will also be reflected in lower costs for the livestock enterprises where home-grown feed is used.

Estimated net margins including allocated fixed and imputed costs are also shown. These costs are allocated pro rata based on the number of livestock units (LU) and the land area allocated to individual enterprises. The imputed costs cover unpaid labour (based on standard rates for hours input) as well as rental value for owner occupied land and interest on tenant-type capital adjusted for actual interest payments. This ensures that the costs of the farm-family's own labour, land and capital resources used in the business are accounted for.

Table 11 presents dairy data for the identical and full samples. The **identical** sample comprised of 38 organic and 89 comparable conventional dairy holdings over two years. Both organic and conventional holding output was higher in 2013/14 to those in 2012/13, but variable costs were also slightly higher. Overall, both sector gross margins (GM) were higher, organic increasing by £164/cow, conventional up by £227/cow. Fixed costs increased for both sectors, but after the addition of support payments the organic Net Margin (NM) improved to £148/cow, almost identical to the conventional figure of £150/cow.

Table 11 also contains results for the **full** sample of 41 organic dairy enterprises and 221 comparable conventional enterprises. Organic farm output and variable costs were slightly lower but organic fixed costs were higher. After the addition of imputed costs and support payments the organic net margin was £136/cow, compared to £100/cow for the conventional holdings.

Table 12 shows organic LFA cattle gross margins to be above conventional levels, whilst in the lowlands organic and conventional herds are more similar in gross margin. With the addition of fixed and inputed costs, combined with support payments the overall organic net margins are superior to the conventional level, though in the lowlands both sectors achieved a negative margin.

Table 13 indicates that organic sheep gross margins were similar to conventional levels in the LFA, but organic GMs were greater than conventional in the lowlands due to similar or higher outputs and lower variable costs. However, organic sector fixed costs were greater per ewe and after the addition of support payments and imputed costs both organic and conventional sectors resulted in negative NMs.

Table 14 presents crop gross and net margin data for 2013/14. Whilst organic gross margins were generally similar or higher, net margins excluding support payments were negative for virtually all crops (both organic and conventional). With the inclusion of support payments and imputed costs organic net margins were generally ahead of the conventional sector (with the exception of spring wheat and winter oats).

Table 11 Summary of organic and conventional dairy gross and net margins (£ per cow, $2012/13 \ and \ 2013/14$

4. Benchmark costs of production

Detailed cost of production data for dairy and sheep are shown in Appendix 3 (page 90), but summary data are shown in Table 15 to Table 17.

Costs of production data is collected in Wales for dairy, beef and sheep systems, but under the existing data collection system for England it is not possible to obtain the sale/transfer weights needed to calculate costs of production for beef and lamb. Therefore dairy and arable data is available for both England and Wales, but only Welsh data is available for beef and sheep sectors, with some of the beef samples comprising only 6 holdings. The Welsh dairy costs of production sample was only 3 farms therefore the farms are included in the overall results but cannot be shown as a sub-sample.

Where possible, comparable conventional farm data is shown and represents results for all farms for which costs of production data were collected. The clustering approach used for selecting comparable conventional farms for the whole-farm data presented in this report could not be used in this case. The England and Wales samples use enterprise data from conventional farms that were part of clusters for the whole farm analysis, whilst the Welsh conventional farm data is an average of all conventional holding data collected for that enterprise.

The cost of production data are calculated according to standard procedures whereby the variable costs relate to actual enterprise costs while the forage costs are apportioned according to the weighting of the livestock enterprise on the basis of livestock units associated with each livestock enterprise. This method is also carried out for allocating the fixed/overhead costs and other outputs, except that there is a further adjustment to account for the weighting of any arable enterprises within the whole farm system. Here, values are allocated on the basis of livestock units and the percentage area that is utilised by the livestock enterprises as a whole. This method assists preventing the allocation of arable costs to the livestock enterprises. All outputs and costs are then divided by the unit of production (litres for milk, kg liveweight for stores and deadweight for finished beef and lamb production, tonnes of yield for arable).

To fully reflect costs and put businesses on a comparable basis with respect to use of own labour, land and capital resources, imputed values are estimated for unpaid labour (farmer/spouse/other), interest on the farmer's share of tenant's capital (the total on-farm value of buildings, machinery, livestock and milk quota calculated at an interest rate of 6%) and imputed rent (rental value of owner occupied land excluding buildings). These costs are allocated on the same basis as for other fixed costs described above.

Organic variable costs are often lower than conventional due to a lower level of input usage, though fixed costs are often higher per unit of production due to lower physical production over which to spread these costs. (Whole farm data, presented elsewhere in this report does not show a strong pattern of organic farms having higher fixed costs). Although the total cost of production can be higher on organic systems, these are usually off-set by higher levels of support payments.

4.1 Dairy enterprise production costs

Dairy costs of production were calculated from the Defra dataset for England and Wales, which provided data from 41 organic and 221 comparable conventional holdings, as well as an identical sample of 38 organic and 89 conventional farms for 2013/14 and 2013/14. The England and Wales data is summarised in Table 15; more detailed results are shown in Appendix 3 starting on page 90.

England & Wales Identical Sample

The identical sample data indicated a slightly increased milk yield for both organic and conventional holdings, with enterprise output rising slightly for both conventional and organic farms. However, both organic and conventional variable costs were also higher, as were fixed costs. Overall, the organic and conventional net margins (excluding support payments) were improved in 2013/14.

England & Wales Full Sample

The full sample indicates a similar pattern of greater organic output but higher variable and fixed costs, resulting in a similar net margin between sectors.

4.2 Beef and lamb enterprise production costs

Costs of production data for beef and lamb were only available for Welsh farm data, as livestock sale weights are not collected by FBS in England. The sample sizes are relatively small in 2013/14 and it was not possible to show beef finishing data for 2012/13. Summary data is presented in Table 16, with more detailed data shown in Appendix 3 starting on page 90.

Breeding beef suckler store production

The sample of 11 Welsh organic holdings achieved lower output than conventional holdings, with less output per hectare and a lower average price. However, due to lower costs the organic gross margin was 46% higher at 92p per kg LW. Due to lower physical output, organic fixed costs were higher per kilogram. Even after the addition of support payments the overall net margins were negative for both sectors.

Finished (trading) beef production

The finishing beef sample was small in 2013/14 and too small to publish in 2012/13, however the results indicate that the organic holdings achieved greater output, combined with lower variable costs, but higher fixed costs to achieve a greater overall net margin.

Finished (trading) lamb production

The sample of 12-13 Welsh organic finished lamb producers achieved an identical price and total output to conventional producers, but physical output was much lower. Organic variable costs were lower than conventional, mainly due to lower feed and forage costs, but organic fixed costs were much higher, in main due to the lower physical production. Overall, the organic net margin was substantially worse than the conventional level, and the addition of imputed costs and support payments does not improve the position.

Overall, the livestock costs of production data indicates the poor financial return from breeding beef and lamb production, with significant losses per hectare even after support payments.

4.3 Cropping enterprise production costs

Costs of production data for crops are based on net margin data per hectare converted to per tonne output figures. In general the data shows organic gross margins to be higher due to lower input costs, but higher organic fixed costs due to lower production yields. Overall however, organic net margins per tonne are often higher than conventional levels, especially with the inclusion of support payments.

Appendix 4 The farm classification system

For each farm in the survey, each hectare of crop area and each head of livestock are assessed in terms of Standard Output (SO). These SO are expressed in European Currency Units, with 1200 such units equivalent to 1 European Size Unit (ESU).

Farm size is measured for a particular farm by the number of ESUs registered in total, and this is thus a measure of the size of the farm business. It is a measure of the economic size of businesses in terms of the value they add to variable inputs and thus differs from physical measures, such as area, which take no account of the intensity of production. The survey is designed to cover farms of at least 8 ESU in size.

Farm type is determined for a particular farm by the proportion of the SO total accounted for by each enterprise. Precise details of the typology are complex, but may be summarised as follows:

Farm type Characteristics

Cereals Farms on which cereals and other crops generally found in cereal

rotations account for more than two thirds of their total SO.

General cropping Farms on which arable crops (including field scale vegetables)

account for more than two thirds of their total SO excluding farms

classified as cereals.

Horticulture Holdings on which fruit (including vineyards), hardy nursery stock,

glasshouse flowers and vegetables, market garden scale vegetables, outdoor bulbs and flowers, and mushrooms account for more than two

thirds of their total SO.

Poultry Farms where poultry account for over two thirds of total SO.

Dairy Farms where the dairy enterprise, including followers, accounts for

over two thirds of the total SO. A holding is classified as a Less Favoured Area (LFA) holding if 50% or more of its total area is in the

LFA.

LFA Cattle and Sheep Farms in the LFA on which cattle, sheep and other grazing livestock,

other than dairy cattle account for over two thirds of total SO.

Includes holdings classified as Severely Disadvantaged Area (SDA) if land is 50% or more within the SDA, and Disadvantaged Area (DA),

if land is more than 50% within the DA.

Lowland Cattle and Sheep Farms outside the Less Favoured Areas on which grazing livestock,

other than dairy cattle, account for over one-third, commonly over two-thirds, of total SO, and form the largest enterprise group, or farms on which grazing livestock (except dairy cattle) and field crops each

account for over one-third but less than two-thirds of total SO.

Mixed Includes mixed pig and poultry farms as well as farms with a mixture

of crops and livestock, not classified elsewhere due to their mixed

status.

Appendix 5 Definition of terms and abbreviations

Breeding Livestock Appreciation (BLSA)

BLSA is that element of Net Farm Income resulting from changes in breeding livestock prices between the opening and closing valuations. It is calculated by multiplying for each category of breeding livestock the change in the opening and closing valuations by the average number of livestock in that category during the year.

Cash Income

Cash income is based on actual receipts and actual expenditure. It represents the difference between receipts and expenditure on current account, before depreciation charges and investment spending.

Effective Hectares (Eff. ha)

The effective hectares constitutes the total farm area minus the area occupied by roads, woodland, wasteland and buildings, and with rough grazing expressed in terms of their pasture equivalent. E.g. on a particular farm, 20 hectares of rough grazing in terms of its capacity to carry stock may be worth 4 hectares of permanent pasture - it is therefore regarded as being 4 effective hectares. A notional area is also estimated for the use made of any common grazing.

Enterprise Output

Enterprise output is all returns from an enterprise, plus the market value of any of its products transferred out to another enterprise, plus the market value of any production from the enterprise given to workers or consumed on the farm. In the case of livestock enterprises, the value of purchased livestock and the market value of livestock transferred in from another enterprise are deducted. All totals are adjusted for changes in valuation. Milk output includes quota transactions and any superlevies paid, have been deducted.

General Farming Costs

General farming costs include electricity, water and telephone charges, licences, insurances, subscriptions, professional charges, etc.

Farm Business Income

Farm Business Income (FBI) represents the return to all unpaid labour (farmers, spouses and others with an entrepreneurial interest in the farm business) and to all their capital invested in the farm business including land and farm buildings. It is defined as Total Farm Output (TFO) plus profit/loss on sale of assets minus costs (C), where: TFO is defined as the sum of output from: crop enterprises, adjustment for disposal of previous crops, livestock enterprises, separable non-agricultural diversification, single farm payment, agri-environmental payments, other grants and subsidies, miscellaneous receipts; C is defined as variable costs plus fixed costs.

Livestock Units (LU) and Grazing Livestock Units (GLU)

Livestock numbers are converted to livestock units, which are based on estimated energy requirements, in order to calculate the total stocking of grazing livestock on the farm. The following conversion factors are used:

Dairy cow	1.00	Hill ewe	0.06
Beef/hill cow	0.75	Upland ewe	0.08
Beef/dairy bull	0.65	Lowland ewe	0.11
Beef/dairy heifer	0.80	Ram	0.08
Other cattle – 2 years old and over	0.80	Ewe lamb	0.08
- 1 to 2 years old	0.65	Other sheep 1 year old and over	0.08
- under 1 year old	0.34	Store lamb under 1 yr.	0.04

Margin over concentrates

Margin over concentrates is the difference between milk sales and the value of purchased and home grown concentrates used for the dairy herd.

Miscellaneous Output

Miscellaneous output includes contract work, farm cottage rents, benefit value of farmhouses, and profit on resale of purchased agricultural produce.

Net Farm Income (NFI)

NFI is total farm enterprise output less total inputs (excluding the value of the labour of the farmer and spouse). It is calculated as if all farms are tenanted, and represents the return to the farmer and spouse for their labour and management, and on the tenant-type capital of the business.

Net Worth

Net worth is the difference between total assets and total liabilities and represents the value of assets available to the business, all other claims against these assets having been met.

Occupier's Net Income

Occupier's net income is based on actual tenure and indebtedness. It represents the return to the farmer and spouse for their labour, management and investment in the farm business.

Other Crop Costs

Other crop costs include crop protection chemicals and other costs incurred specifically for crop enterprises and forage.

Other Livestock Costs

Other livestock costs include purchased bedding materials, and other costs incurred specifically for livestock enterprises.

Owner Equity

Owner equity is net worth expressed as a percentage of total assets.

Rental Value

For owner-occupied farms, a rental value is imputed to make it possible to compare results with farms on which rents have to be paid.

Return on All Capital

Return on all capital is management and investment income plus rental value expressed as a percentage of total capital.

Return on Tenant's Capital

Return on tenant's capital is management and investment income expressed as a percentage of total tenant's capital.

Tenant's Capital

Tenant's capital is the value of livestock, machinery, crops (including cultivations) and stores. In the tables, it is expressed as the average of the opening and closing valuations for these items.

Utilisable Agricultural Area

UAA is the land area that is actually farmed by the farmer excluding areas such as roads, farm yards, buildings woodlands, water or unused rough grazing.

Abbreviations used throughout text include:

ALU – Annual Labour Units

CCF – Comparable Conventional Farms

ESU - Economic Size Unit

FBI – Farm Business Income

FBS – Farm Business Survey

GM – Gross Margin

LFA – Less Favoured Area

LU – Livestock Unit

MII – Management and Investment Income

NM – Net Margin

NFI – Net Farm Income

OFS - Organic Farming Scheme

SFP – Single Farm Payment

SGM – Standard Gross Margins

SO – Standard Output

UAA – Utilisable Agricultural Area

Appendix 6 Numbers of farms to be sampled/recruited by type and region

The recruitment targets set in 2006/07 were based on an analysis of registered organic businesses in 2005, classified by farm type and GOR (government office region), and have been maintained into 2013/14. The guideline target samples try to ensure that the population distribution is reflected. To increase the useable data, new businesses recruited should have more than 70% fully organic land.

For England from 2006/07, it was agreed with Defra that guidelines for a minimum of 140 farms (70 in the main FBS and 70 from the supplementary data collection covered by this project) should provide for a minimum of 6 in each type category (see table), except:

- a) In the case of the LFA (DA & SDA) cattle and sheep categories, as these can be combined with each other and with Welsh data to achieve the 5 minimum.
- b) Horticulture, where the priority should be to achieve a minimum of 6 for each of 'small-scale market garden' and 'larger scale field vegetables' within the other horticulture category. If recruitment enables the specialist glass and fruit categories to be increased to 5 or 6, that would be welcome, but was not a requirement.
- c) Specialist poultry and pigs, where the organic population is too small.

For Wales, the recruitment priorities identified, taking account of the existing samples, are:

- a) Improve balance between LFA and lowland dairy if any lowland dairy farms drop out
- b) Recruit horticultural businesses if any cropping or mixed farms drop out
- c) Maintain current lowland cattle and sheep numbers
- d) Focus on recruiting LFA (DA) cattle & sheep businesses.
- e) Within the SDA groups, cattle and sheep businesses are over-represented, and specialist sheep are underrepresented, so if any drop out of the former, they could be replaced by the latter if possible.

Appendix 7 Organic and conventional farm comparisons

A key aspect of this research work was to derive a cluster of similar conventional farms for each organic farm to provide comparison data. By generating comparison farm data, it is possible to determine and understand further the economic performance of organic farms, their relative competitiveness and the impact of policy on them in relation to conventional farms.

5.1.1 Background

Issues relating to comparing results from organic and conventional farms have been discussed by Lampkin and Padel (1994)⁵ and Offermann and Nieberg (2000).⁶

The conventional farms selected need to be 'comparable'. The objective is to isolate the effect of the farming system on profits, so the choice of characteristics for comparison must be restricted to 'non-system determined' factors, i.e. location (climate, topography, soil, and market distance), size and tenure. The use of clusters of similar conventional farms to compare with each organic farm has the advantage over paired farm comparisons in that specific circumstances of individual conventional farms do not distort the comparison. The average for a group of organic farms can then be compared with the average for the group of matched clusters with greater confidence when the farm size, type and location characteristics of the organic and conventional groups are similar.

The idea of using clusters of conventional farms for comparisons has been carried out before (Fowler et al., 1999)⁷, using a hierarchical cluster analysis technique on the basis of Euclidean squared difference; however, the method of clustering has been changed in this study.

5.1.2 Conventional farm selection

For each organic farm recorded, the aim was to generate a cluster of at least three comparable conventional farms (CCF) from the Farm Business Survey database (Defra, 2007)⁸. The emphasis for selection of comparable conventional farms for this study was to focus on resource endowment identifiers/variables. The resource endowment of the business is normally independent of the organic or conventional management, and is a reflection of the resources with which the farm manager can run the farm business.

The main identifiers required to be identical for determining resource endowment include:

- Region (FBS province) assists with selecting farms with similar production conditions (i.e. location, market distance, institutional and policy frameworks);
- Less Favoured Area and Non- Less Favoured Area status (See Table A9);
- Altitude (See Table A10);

• Main farm type, which is a more descriptive typology than the robust type (see Table A11).

Cropping, cattle & sheep	17			
Cropping, pigs & poultry	18	Mixed		
Cropping & mixed livestock	19			
Mixed livestock	20			

To prevent limiting the number of CCFs unduly, the above variables were reassigned different codes to allow some flexibility in deriving the comparison farm data.

To identify comparable farm data with similar resource endowment, pre-defined ranges were used for land (UAA), milk quota ownership (dairy farms only), proportion of permanent pasture and rough grazing land, and the farm business size in standard outputs (ESU) per farm. The range was defined by a percentage deviation from the value of the respective organic farm (e.g. +/- 20%) and/or an absolute value to prevent organic farms with small values being lost from the sample. Overall, the combination of variables for deriving farm clusters can be taken as a reasonable guide to identifying comparable resource endowment.

For all farm types, a standard procedure was undertaken to determine the comparable data selection per organic farm. However, it was not possible to achieve a reasonable number of CCFs in 33% of cases. Therefore, a hierarchical clustering approach was used, by adding farms of the same type from adjacent regions and on occasion increasing the pre-defined ranges per farm type (See Box 1 and Table A13).

Box 1 Conventional farm selection procedure

Farm business size, as measured by standard gross margins, is a measure of the potential economic activity of the particular mix and size of enterprises on the farm.

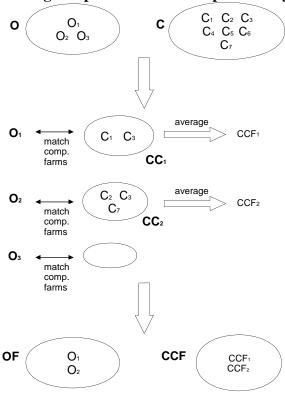

Table A14 Summary table to show the procedure used per farm type and the CCF results achieved (2013/14 farms)

Farm type	Cropping Hort.		Dairy	Cattle and sheep		Mixed	Total
· -	All	All	All	LFA	Lowland		
Total organic farms	22	13	39	41	40	31	186*

Resulting final cluster statistics							
Average number of farms in cluster per organic farm	7.47	3.64	11.56	7.15	6.87	6.76	7.2
No. of organic farms with 5 or more farms (CCF) per cluster	12	1	35	22	29	15	114
% of organic farms with 5 or more farms (CCF) per cluster	63%	9%	90%	54%	73%	52%	64%
Range of CCF per organic farm per farm type: Minimum	3	3	3	3	3	3	3
Maximum	29	6	49	24	15	24	25

^{*=}Additionally, there were 3 "poultry" and 1 "pig" typology organic farms in the Defra dataset (excluded due to sample size)
**=Quota now removed as a cluster parameter

Once the comparable conventional farm data were identified from the main Farm Business Survey database (sample C in Box 2) and for the organic farms (sample O), the comparable conventional farm data for each cluster (CC_n) were averaged. This effectively creates a single ('artificial') comparable conventional farm CCF_n for each organic farm (O_n). Note that farms from sample C could be used more than once (in different clusters). All organic farms with no comparable data were removed from sample O, leaving set OF as the subset of sample O with matching clusters, and CCF as the set of averages for each cluster of non organic businesses drawn from sample C. The robust type comparative analysis presented in this report is based on average values for businesses matching the robust type criteria drawn from OF, compared with average values for their corresponding clusters drawn from CCF.

Box 2. Procedure for determining comparable farm data per farm type

Source: Offermann, 2004. 9

5.1.3 Interpretation of results

As discussed earlier, the farms have been classified by Standard Output (SO), a typology system originally devised for conventional agricultural systems (see Appendix 2) and therefore not entirely appropriate for organic farms. Further, because of the systematic differences in structure on organic

IBERS, Aberystwyth University/Organic Research Centre

Offermann, F. (2004) Selection of comparable conventional farms: Some considerations for a general guideline. Unpublished project guidelines, Further Development of European Organic Farming Policy Project (www.irs.aber.ac.uk/euceeofp).

farms, clustering conventional farms is still only an approximate guide to the possible performance of organic farms if they were managed conventionally or vice versa.

The sample size for the comparison clusters is sufficiently large for a degree of confidence in the average value; however, there is still a possibility for outliers (especially larger farms) to have some disproportionate influence on the average.
