Federico II

European Joint Organic Congress
Organic Farming and European Rural Development
30 & 31 May 2006 in Odense Denmark

Theme 2: European Policy Initiatives
C2 - Policy Initiatives for Organic Farming

An integrated methodology for the evaluation of organic farming aid scheme environmental effects supported by Geographic Information Systems (GIS)

Outline

- ⊕ Preliminary remarks and motivations
- ⊕ Research aims
- ⊕ The case study
 - ⊕ *RDP in Campania (organic farming)*
 - ⊕ *Methodology*
 - ⊕ *Procedure*
- ⊕ Results
- ⊕ Concluding remarks

Preliminary remarks and motivations

⊕ EU member states are now obliged to evaluate

Rural Development Plans (RDPs)

⊕ verify the effectiveness of the implementation process

⊕ The evaluation:

⊕ must be based on quantitative indicators

⊕ must consider both spatial and geographic context

Research aims

Proposing an integrated evaluation methodology
for analysing a RDP agro-environmental measure
(organic farming)

⊕ Evaluate whether the implementation of this
measure matches local needs of environment
improvement

GIS (Geographic Information Systems)

GIS are systems able to store, manage
and display spatially referenced data

They support evaluation methodologies

- spatial analysis tools
- quantitative indicators calculation on spatial basis

The case study: RDP organic measure of Campania

Figure 2 - European and Italian Map with indication of the Italian Regions

A snapshot of organic farming in Campania

R. 2078/92 has played a key role in fostering organic farming in Campania

At the end of the program implementation (2003):

- ⊕ 1.955 farms
- ⊕ 15.000 ha
- ⊕ Cereals (23% UAA)
- ⊕ Fruit and olive trees (18% UAA)
- ⊕ Chestnut trees (15% UAA)
- ⊕ Forages (14% UAA)

2003: organic farming state faced by the new aid scheme under the RDP

Increasing of:

- ⊕ Farms
- ⊕ Products available
- ⊕ Stores
- ⊕ Processing and marketing holdings
- ⊕ Consumers

Flaws:

- ⊕ Mainly inland and less-favoured areas
- ⊕ Mostly focused on production side rather than processing, marketing and demand side

The case study: methodology

With the support of GIS, economic data (aid scheme beneficiaries) has been analysed with respect to its spatial context

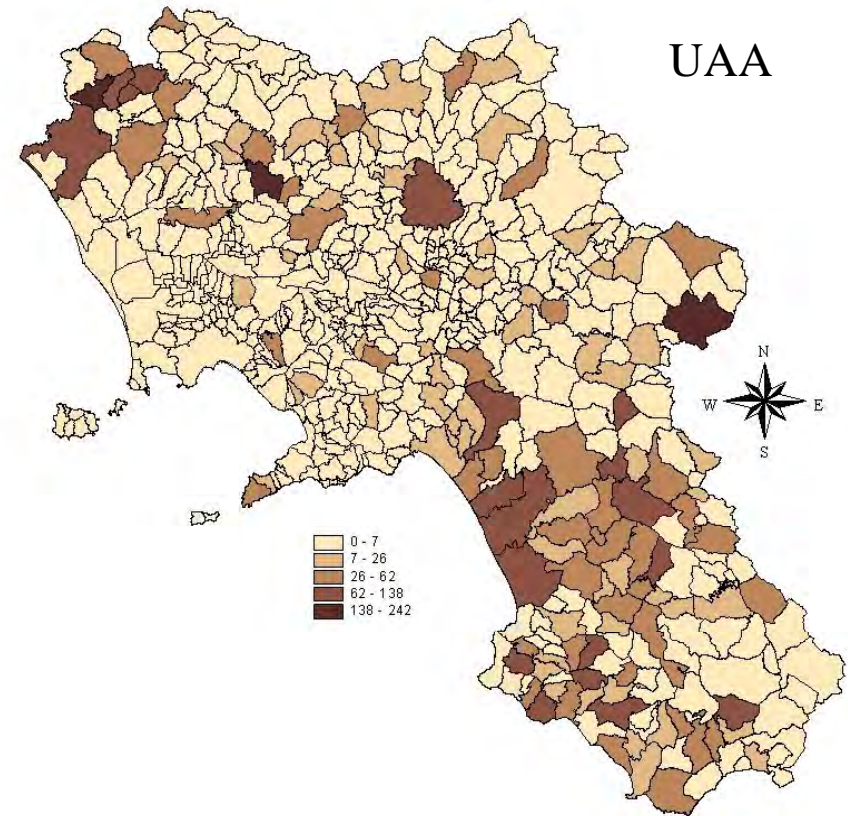

The case study: procedure

Each kind of data is elaborated in informative layer, then integrated and intersected with other informative layers

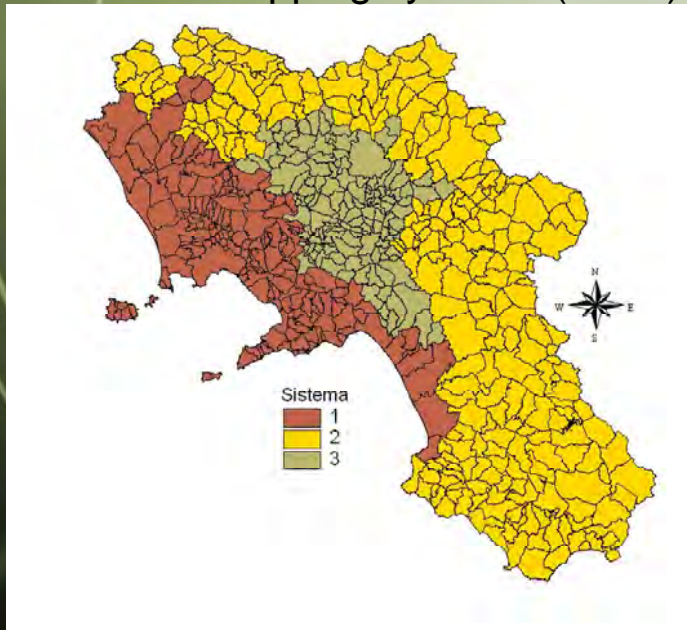

First informative layer

Intervention distribution and concentration map
(organic/total) in terms of farms and UAA

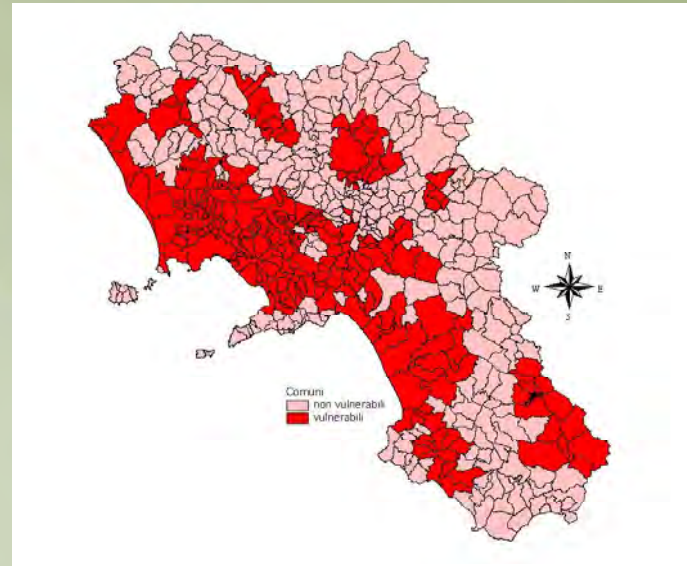

Other informative layers

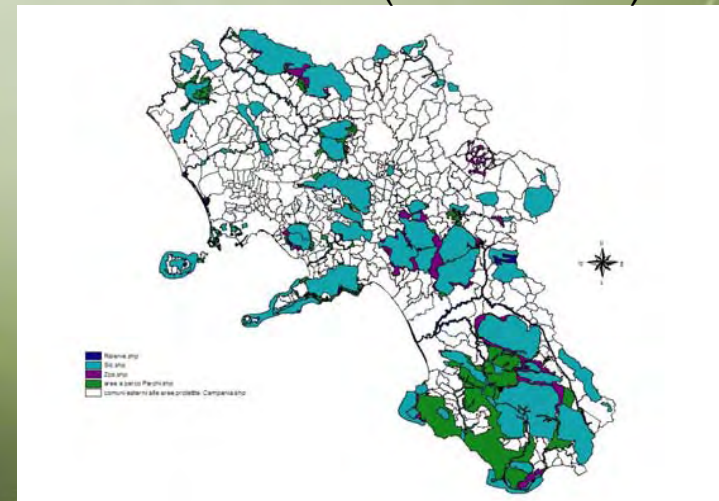

Intensive cropping systems (1-2-3)

Nitrates Vulnerable Zones (VZ)

Protected areas (Natura 2000)

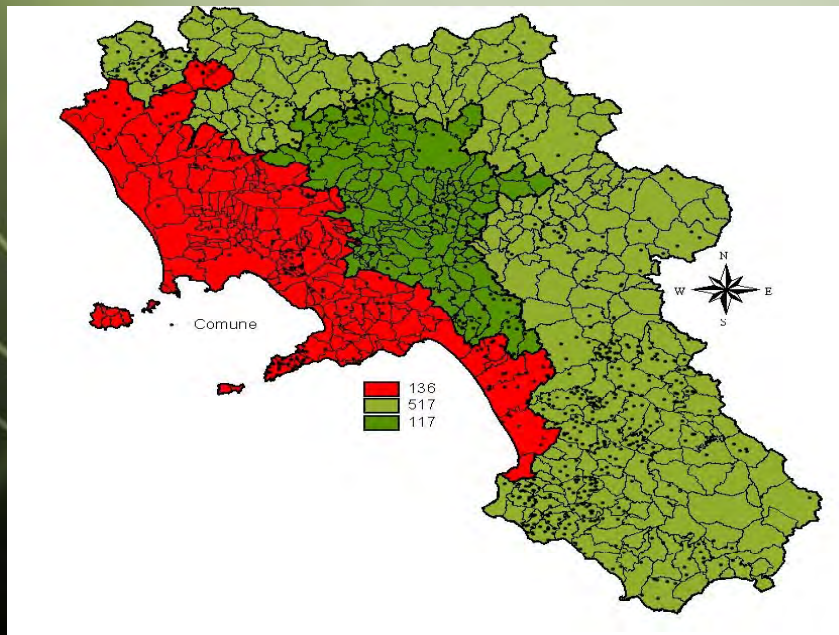

Results: key notes (1/2)

Organic farms in Vulnerable Zones

Total number	317
% All farms	0,2

Organic farms out Vulnerable Zones

Total number	447
% All farms	0,4

Organic farms in the most intensive cropping system areas (1)

Total number	136
% All farms	0,2

Organic farms in the least intensive cropping system areas (3)

Total number	517
% All farms	0,5

Organic farms in the medium intensive cropping systems (2)

Total number	117
% All farms	0,2

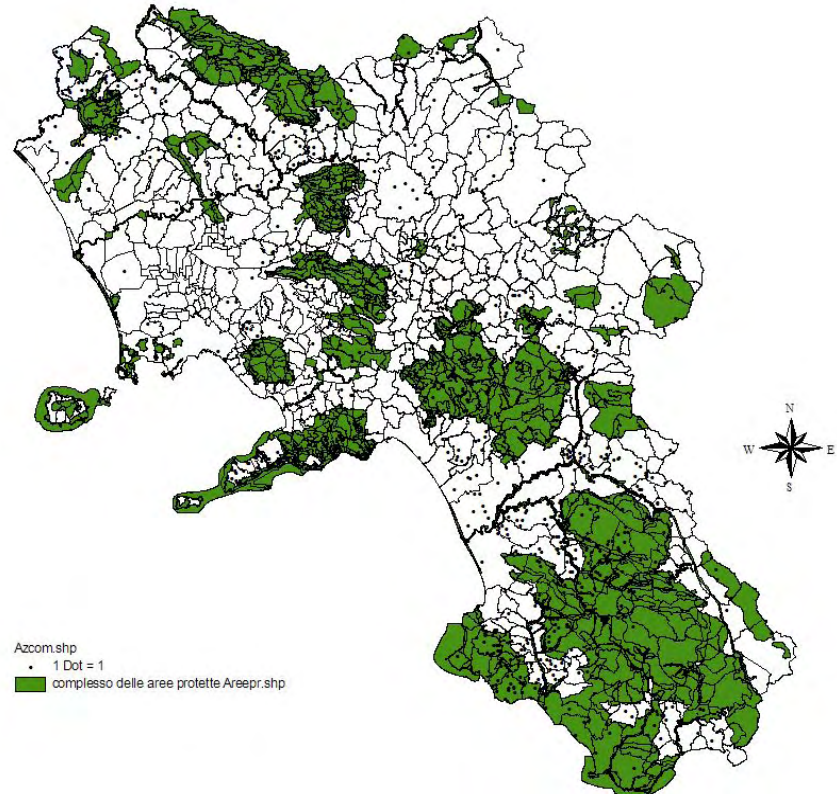

Organic farms in protected areas

Total number	650
% All farms	0,38

Organic farms out protected areas

Total number	120
% All farms	0,16

Results: key notes (2/2)

Results

In spite of the regional RDP strategy aiming to concentrate the organic farming intervention on the critical areas from an environmental point of view, there is no significant difference in the distribution of organic farms and land between nitrates VZs and non VZs, and between more and less intensive agriculture areas

Results

A major concentration transpires to be
in the protected areas.

They mostly overlap regional less-
favoured areas.

Organic farming confirms to be a
convenient alternative where a low
impact agriculture already exists

Concluding remarks

The effectiveness in achieving environmental benefits from organic farming aid scheme has been reduced by implementation not focusing on the regional areas more in need of environmental improvements
